

# Paths: North-South Distance Larger

Start with an the first (odd) run on an odd level going east. Go to the corresponding square box at the even level when the runs at that level are complete. For this example, this is after 3 runs if the total number of runs at a level is odd, after 4 runs otherwise, Go back to the even level when the run at that level is complete. For this example, this is after 6 runs if the total number of runs is odd, after 8 runs otherwise. Alternatively start with the first (odd) run on an odd level going west.

(If the east – west distance is larger, substitute north for west, west for north, south for east, and east for south, and turn the drawing sideways.)
